

Welcome to Pick Modeller®

Pick Modeller is a revolution in warehouse picking productivity software.

It radically improves productivity by replacing average pick rates and estimates of order completion times with accurately modeled target times.

Pick Modeller analyses layouts, highlights problems and suggests product moves that reduce travel time and save money.

Pick Modeller will drive continuous improvement processes that will improve productivity and reduce costs.

Pick Modeller works with any WMS

Using a simple interface, Pick Modeller will work with any warehouse management system and is designed to be totally scalable giving a great ROI for operations employing as few as ten pickers.

Even warehouses using paper pick lists will benefit, as Pick Modeller can automate the allocation of order sheets, capturing actual assignment times.

Target vs. Actual

Pick Modeller calculates a target time for each assignment. It then collects details about the actual performance of the picker assigned to that order. The analysis of the variance between what was expected and what was achieved will help clarify organisational bottlenecks and will highlight which individuals require support to improve performance.

Powerful insight into layout efficiency

Pick Modeller provides many tools to analyse the efficiency of your picking operation allowing you to make informed decisions about stock flow and product placement.

Information at SKU and bin level show where product misplacement is costing money in wasted travel time.

Rich Graphical Interface

Pick Modeller's rich graphical interface makes it easy to use.

Line management will quickly find that the software's intuitive controls give them quality information to manage the operation and control costs.

With Pick Modeller, it is easy to print richly detailed reports to support informed decision-making and swift action.

Less overtime and reduced agency costs

Using a software map of the facility along with standard timings, Pick Modeller analyses the pick data prior to the start of the shift. This allows more accurate resourcing decisions.

Clear measurable targets will better motivate staff and result in reduced overtime and agency costs.
